

Bolts

Grade 8.8 or 10.9 hot-dip galvanised silo bolts are used. The bolts have a polypropylene-coated flat head with a large diameter to allow for the involved forces to be applied evenly into the enamelled plate.

The coatings are chemically resistant, hygienic, and achieve a particularly effective seal against the glass surface due to the large surface area.

Sealing compounds

Sealing compounds are selected according to the various applications and are carefully selected to counter the abrasive effects of the respective chemicals. Test certificates for all sealing compound types can be supplied.
